

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

June 2005

Prolonged decreases in the primary metals leading index and its 6-month smoothed growth rate are indicating further declines in metals industry activity. The metals price leading index growth rate returned to its downward path, suggesting more decreases in metals price growth in the near term.

The primary aluminum and the aluminum mill products indexes are suspended because of discontinued availability of industry-specific historical data. The USGS will continue to calculate the steel and copper composite indexes.

The **primary metals leading index** decreased 2.7% in May to 136.8 from a revised 140.6 in April, and its 6-month smoothed growth rate dropped to -8.2% from a revised -3.8% in April. The 6-month smoothed growth rate is a compound annual rate that measures the near-term trend. Normally, a growth rate above +1.0% signals an upward trend for future growth in metals activity, while a growth rate below -1.0% indicates a downward trend. For an explanation of these indexes and a definition of the primary metals industry, [see page 10](#).

The average workweek in primary metals establishments was 0.6 hour shorter in May than in April. It contributed -1.4 percentage points to the net decline in the leading index. Metals prices have decreased enough that the JOC-ECRI metals price index growth rate fell below zero in May, its first negative reading since the beginning of 2002. It contributed -0.9 percentage points to the leading index. The Institute for Supply Management's PMI declined in May contributing -0.5 percentage points. The PMI gauges domestic manufacturing activity and a measurement below 50.0 signals a decrease in manufacturing activity. Although the PMI remains above this threshold, it has generally declined since July. Furthermore, growth in manufacturing activity appears to be limited to regional expansions. The contribution from the small increase in the combined S&P stock price indexes for construction and farm machinery companies and for industrial machinery companies rounded to zero. Only four of the leading index's eight components were available for the May index calculation. The primary metals leading index will likely be revised next month when the remaining four components become available.

The primary metals leading index growth rate has been negative for four consecutive months and appears to be signaling that primary metals activity will decline further in the near future.

The **steel leading index** decreased 1.2% in April, the latest month for which it is available, to 117.6 from a revised 119.0 in March. Its growth rate dipped into negative territory in April, sinking to -0.7% from a revised 2.0% in March. Sharp drops in the S&P stock price index for steel companies and the growth rate of inflation-adjusted M2 money supply made the most negative impact on the leading index in April. Decreased new orders for steel products and lackluster sales of new cars and light trucks also suggest slow steel activity growth. In contrast, increased new housing permits issued in April offset some the decline in other indicators. Nevertheless, the leading index growth rate has declined sharply since the end of last year and now suggests that steel activity could continue to slow in the months ahead.

The **copper leading index** decreased 0.7% in April to 128.2 from a revised 129.1 in March, and its 6-month smoothed growth rate declined to -0.2% from a revised 1.3% in March. All of its six indicators declined in April, with the exception of new housing permits issued. Strong regional construction activity is skewing the national construction industry outlook. The yield spread between the 10-year Treasury Note and the federal funds rate resumed its decline in April. When this indicator falls below +1.0, which it is very close to, metals activity usually declines. The copper leading index growth rate suggests that industry activity growth could be flat-to-slow over the next few months.

Downward Pressure on Metals Price Growth in the Months Ahead

The **metals price leading index** fell 1.5% in April, the latest month for which it is available, to 108.0 from a revised 109.7 in March, and its 6-month smoothed growth rate slid to -4.3% from a revised -2.0% in March. All of its three available indicators retreated from their upticks in March and made negative contributions to the leading index in April. The decrease in the growth rate of the index measuring the trade-weighted average exchange value of other major currencies against the U.S. dollar made the largest negative contribution, -1.0 percentage point, to the leading index. A tighter yield spread between the U.S. 10-year Treasury Note and the federal funds rate contributed -0.4 percentage points. The growth rate of the inflation-adjusted value of new orders for U.S. nonferrous metal products contributed -0.1 percentage point. The fourth index component, the growth rate of the Economic Cycle Research Institute's (ECRI) 18-Country

Long Leading Index, was only available through March. It suggests slow-to-modest growth in global economies. The ECRI 18-Country Long Leading Index signals changes in the growth of economic activity in major industrialized countries about 5 months in advance.

The growth rate of the inflation-adjusted value of inventories of U.S. nonferrous metal products, which is an indicator of metals supply, advanced to -2.3% in April from a revised -3.8% in March. This indicator usually moves inversely with the price of metals. Furthermore, weaker domestic and global demand for metals will likely keep pressure on metals price growth as indicated by the metals price leading index.

The business cycle and inventories are only two factors in metals price determination. Other factors that affect prices include changes in metals production, speculation, strategic stockpiling, foreign exchange rates, geopolitical instability, and production costs.

Table 1.
Leading Index of Metal Prices and Growth Rates of the Nonferrous Metals Price Index, Inventories of Nonferrous Metal Products, and Selected Metal Prices

Six-Month Smoothed Growth Rates						
	Leading Index of Metal Prices (1967=100)	MII Nonferrous Metals Price Index	U.S. Nonferrous Metal Products Inventories (1982\$)	Primary Aluminum	Primary Copper	Steel Scrap
2004

May	NA	0.3	NA	-9.9	6.6	-26.8

NA: Not available r: Revised

Note: The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Economic Cycle Research Institute's 18-Country Long Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available **r:** Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 2.

PRIMARY METALS: LEADING AND COINCIDENT INDEXES, 1983-2005 1977=100

Shaded areas are business cycle recessions. Asterisks (*) signify peaks (the end of an expansion) and troughs (the end of a downturn) in the economic activity reflected by the indexes.

CHART 3.

PRIMARY METALS: LEADING AND COINCIDENT GROWTH RATES, 1983-2005 Percent

Shaded areas are business cycle recessions.

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

CHART 6.
COPPER: LEADING AND COINCIDENT INDEXES, 1983-2005

CHART 7.
COPPER: LEADING AND COINCIDENT GROWTH RATES, 1983-2005

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the five metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel, aluminum, and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. In general, metal industry indexes starting in 1997 begin to reflect the NAICS classification, while indexes for earlier years follow the SIC. Hence, composite indexes from 1997 forward are not entirely consistent with those of earlier years.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing has been removed from primary metals and added to electrical equipment, appliance, and component manufacturing. Because monthly shipments and new orders for this wire are not available, the USGS is estimating their values from 1997 onward and adding them to the appropriate metal industry indicators and indexes to maintain consistency.

¹**Business Cycle Indicators, A monthly report from The Conference Board** (March 1996).

There are other small changes to the primary metals industry because of the switch to the NAICS. Coke oven activity not done by steel mills, for example, is removed and alumina refining, a part of industrial inorganic chemical manufacturing under the SIC, is added. Since the historic trends of the composite indexes are not affected by these small changes, the USGS is not making specific adjustments to the indexes for them for the periods before and after 1997.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next summary is scheduled for release on the World Wide Web at 10:00 a.m. EDT, Friday, July 22. The address for *Metal Industry Indicators* on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the Minerals Information Team. The report is prepared by Gail James (703-648-4915; e-mail: gjames@usgs.gov) and Ken Beckman (703-648-4916; e-mail: kbeckman@usgs.gov). The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
